Question 1

Assume that student_ID is the number that corresponds to your student ID number.

1. (2pts) What is student_ID % 2? Call this key1

   Possible answers are: 0, 1

2. (2pts) What is student_ID % 5? Call this key2

   Possible answers are: 0, 1, 2, 4
Question 2

Assume timer/counter 0 (if key1 == 0) or 1 (if key1 == 1).

Assume a prescaler of 1 (if key2 == 0), 8 (key2 == 1), 64 (key2 == 2), 256 (key2 == 3) or 1024 (key2 == 4).

1. (5 pts) What is the interval between counts of the timer/counter (tocks)?

   \[ t \ (\text{sec/tock}) = \frac{p \ \text{ticks/tock}}{16,000,000 \ \text{ticks/sec}} \]

   So:

<table>
<thead>
<tr>
<th>key2</th>
<th>p</th>
<th>t</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0.0625 \mu s</td>
</tr>
<tr>
<td>1</td>
<td>8</td>
<td>0.5 \mu s</td>
</tr>
<tr>
<td>2</td>
<td>64</td>
<td>4 \mu s</td>
</tr>
<tr>
<td>3</td>
<td>256</td>
<td>16 \mu s</td>
</tr>
<tr>
<td>4</td>
<td>1024</td>
<td>64 \mu s</td>
</tr>
</tbody>
</table>

2. (5 pts) Assume that we have the overflow interrupt enabled. What is the frequency of interrupts?

   \[ f \ (\text{int/sec}) = \frac{16,000,000 \ \text{ticks/sec}}{p \ \text{ticks/tock} \times x \ \text{ticks/int}} \]

   So:

<table>
<thead>
<tr>
<th>key1</th>
<th>key2</th>
<th>x</th>
<th>p</th>
<th>f</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>256</td>
<td>1</td>
<td>62,500 Hz</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>256</td>
<td>8</td>
<td>7,812 Hz</td>
</tr>
<tr>
<td>0</td>
<td>2</td>
<td>256</td>
<td>64</td>
<td>976.6 Hz</td>
</tr>
<tr>
<td>0</td>
<td>3</td>
<td>256</td>
<td>256</td>
<td>244.1 Hz</td>
</tr>
<tr>
<td>0</td>
<td>4</td>
<td>256</td>
<td>1024</td>
<td>61 Hz</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>256^2</td>
<td>1</td>
<td>244.14 Hz</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>256^2</td>
<td>8</td>
<td>30.52 Hz</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>256^2</td>
<td>64</td>
<td>3.81 Hz</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
<td>256^2</td>
<td>256</td>
<td>0.95 Hz</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>256^2</td>
<td>1024</td>
<td>0.24 Hz</td>
</tr>
</tbody>
</table>
**Question 3**

Suppose we want to produce a regular interrupt every 262*ms*. Assume that we are using a 16 *MHz* crystal for our clock.

1. (5 pts) Which timer should we use?
   Timer 1.

2. (5 pts) Which prescaler should we use?
   Prescaler: 64
Question 4

1. (15pts) Suppose we want a function – called \textit{myfunc}() – to be executed once every 20.97s. Assume a system clock of 16MHz. What is the timer1 prescaler configuration and the code for the interrupt routine (the code does not need to be syntactically correct)? Also - show the code in your main function that configures the timer.

We will use a prescaler of 1024. This gets us down to an interrupt every 4.19 s. We then need an interrupt routine with an additional counter that expires at 5. So, we are left with an interrupt interval of: 
\[5 \times 1024 \times 256 \times 256 / 16000000 = 20.97s.\]

\begin{verbatim}
ISR(TIMER1_OVF_vect) {
    static uint8_t counter = 0;

    ++counter;
    if(counter == 5) {
        myfunc();
        counter = 0;
    }
}
\end{verbatim}

Somewhere in the main program:

\begin{verbatim}
// Interrupt occurs every
// (1024*256*256)/16000000 = 4.19 sec
timer1_config(TIMER1_PRE_1024);
// Enable the timer interrupt
timer1_enable();
// Enable global interrupts
sei();
\end{verbatim}
Question 5

Consider the following code:

ISR(TIMER0_OVF_vect) {
    static uint8_t counter = 0;
    static uint8_t phase = 0;

    if(counter == 0) {
        switch(phase) {
            case 0:
                PORTC |= 3;
                counter = 100;
                phase = 1;
                break;
            case 1:
                PORTC &= ~1;
                counter = 50;
                phase = 2;
                break;
            case 2:
                PORTC &= ~2;
                counter = 75;
                phase = 0;
                break;
        }
    }
    --counter;
}

Somewhere in the main program:

// Initialization
timer0_config(TIMER0_PRE_8);
// Enable the timer interrupt
timer0_enable();
// Enable global interrupts
sei();

DDRC = 0x3;

while(1)
{
}
}
1. (15 pts) Explain in detail what the program does. You are welcome to provide a picture.

Produce two PWM signals at a frequency of 34.722Hz on pins C0 and C1.

\[ f(\text{cycle/sec}) = \frac{16,000,000 \text{ ticks/sec}}{8 \text{ ticks/tock} \times 256 \text{ int/tock} \times (100 + 50 + 75) \text{ int/cycle} } \]

Both pins go high at the same time.

C0 has a duty cycle of 44.44%.

C1 has a duty cycle of 66.67%.
Question 6

Consider the following circuit that we discussed in class:

Assume that a PWM cycle starts at time $t = 0$ with the pin in a state of 5V. At time $t_1$, the pin state changes to 0V. At time $t_2$, the PWM cycle ends (and the new cycle begins).

1. (10 pts) Given an arbitrary $V(0)$, show the equation for $V(t)$ for $0 \leq t < t_1$. Hint: we derived this case in class.

\[
V(t) = 5 - (5 - V(0))e^{-t/RC}
\]

2. (10 pts) Show the equation for $V(t)$ for $t_1 \leq t < t_2$ in terms of $t_1$, $RC$ and $V(0)$. Hint: we derived this case in class (you just need to deal with the shift in time).

\[
V(t) = V(t_1)e^{-(t-t_1)/RC} \\
= \left[ 5 - (5 - V(0))e^{-t_1/RC} \right]e^{-(t-t_1)/RC} \\
= 5e^{-(t-t_1)/RC} - (5 - V(0))e^{-t/RC}
\]
3. (10 pts) Assume that $V(t)$ has reached equilibrium for a given $t_1$ and $t_2$ (in other words: $V(t_2) = V(0)$). Derive an equation for $V(0)$ in terms of $t_1$, $t_2$ and $RC$. Hint: think about the simple cases to check.

$$V(0) = V(t_2) = 5e^{-(t_2-t_1)/RC} - (5 - V(0))e^{-t_2/RC}$$

$$V(0)(1 - e^{-t_2/RC}) = 5(e^{-(t_2-t_1)/RC} - e^{-t_2/RC})$$

$$V(0) = \frac{5e^{-(t_2-t_1)/RC} - e^{-t_2/RC}}{1 - e^{-t_2/RC}}$$

Check 1: duty cycle is 0%. This implies that $t_1 = 0$. Therefore: $V(0) = 0$.

Check 2: duty cycle is 100%. This implies that $t_1 = t_2$. Therefore: $V(0) = 5$

Here is the entire curve (assuming that $t_2 = 100$ time units):
4. (10 pts) **Graduate only.** Define $V_{eq}$ to be this equilibrium voltage at the beginning of the PWM cycle. Show that if $V(0) < V_{eq}$, then $V(0) < V(t_2)$ (in other words, show that in a single cycle, $V$ moves toward the equilibrium).

\[
\begin{align*}
V(0) &< V_{eq} \\
V(0) &< 5 \frac{e^{-(t_2-t_1)/RC} - e^{-t_2/RC}}{1 - e^{-t_2/RC}} \\
V(0)(1 - e^{-t_2/RC}) &< 5(e^{-(t_2-t_1)/RC} - e^{-t_2/RC}) \\
V(0) &< 5e^{-(t_2-t_1)/RC} - 5e^{-t_2/RC} + V(0)e^{-t_2/RC} \\
V(0) &< 5e^{-(t_2-t_1)/RC} - (5 - V(0))e^{-t_2/RC} \\
V(0) &< V(t_2)
\end{align*}
\]

*Equation 1: this is the definition of $V_{eq}$*

*Equation 2: this is only valid if $t_2 > 0$ (which is reasonable)*

*Equation 3: this is the definition of $V(t_2)$*
