

Project #3 Extra Credit

Computer Science 2334

Fall 2007

Description:

You have already been given several suggestions for extra credit for either the GUI or mapper components of this project. (See the descriptions of those projects for details.) You may also receive extra credit for improving upon the basic functionality of the project. For example, the project description only describes reading from results files created by Project #2. However, it might be nice to wrap Project #2 functionality within Project #3. For example, Project #2 read from three files (zip code data, storm data, and query) and created one new file (output). You could extend Project #3 by allowing it to read from these three files and create its own results for mapping. Note, if you do this, you should implement this by extending the GUI (e.g., selecting files using *JFileChooser* dialogs, as well as pulling in the classes and methods from Project #2, because Project #3 is intended to be GUI-driven. How many points you receive for any extra credit attempts will be determined by how useful it is and how well it is explained and implemented.
